

How B-12 Could Help Your Furriest Family Member

October 13, 2016

Is your pet the most optimistic member of your family, too?

And why wouldn't they? We care for their every need much like our own children. We give them shelter, sustenance, and affection and, in return, they gift us with their own special brand of unconditional love.

But, like any family member, our furry friends can get sick. While loved ones can tell us when something doesn't feel right, pets aren't always able to communicate when they're in pain. Some ailments are easy to spot, others can be hidden by that special optimism our pets have for life. It takes a lot to deter a dog's freedom, but lack of weight gain, lethargy, lack of appetite, consistently loose stools, and exocrine pancreatic insufficiency (EPI) are some signs of potentially bad news.

The good news is here: there is often a common denominator to these ailments. Research has shown that insufficient amounts of Vitamin B12 may be what's keeping Fido from fully enjoying his walks or a day at the park.

For both man and his best friend, B12 plays a key role in the creation of personal DNA and in cellular health. It assists us as we heal and recover. For our canine friends, it can also aid in weight gain. This is an important benefit for dogs suffering from EPI.

Common symptoms of EPI are weight loss and an inability to regain that weight. EPI occurs when the pancreas is unable to create the enzymes needed to digest food. This prevents your pet's body from absorbing all the nutrients in your dog's bowl at dinnertime. Just about 82% of dogs with EPI don't get enough B12 and this could be slowing down their recovery and affecting their freedom.

For severe cases of EPI, veterinarians often prescribe treatment in the form of a series of shots, but it's often also recommended that your furry friend receives a B12 supplement as well.

Wonder Labs knows every moment with your pet is precious, so we've developed Pet Factor B12 to assist in your dog's recovery. Pet Factor B12 not only contains the B12 vitamin, but also includes Folic acid and an intrinsic factor. These ingredients are meant to increase the vitamin's chances of assisting Spot's recovery.

Folic acid prepares the B12 for absorption while the intrinsic factor attaches to the vitamin in order to help it be absorbed into the bloodstream. These ingredients set Pet Factor apart from other B12 supplements because they increase the chances of the vitamin being able to aid your dog.

Your pet will always have a happy and free spirit. So, let's step up together and do our part to keep our pets happy, healthy, and energized. Order your Pet Factor B12 today and watch them grow even healthier tomorrow.
